Developing My Skillset

9-28-2019

I would like to believe that my most valuable skill is a mixture of critical thinking or information management, but my chemistry class this semester has put some doubt in this. In my other classes I have been able to understand the concepts either during class or afterward while studying. This makes me think that, at least for my current classes, my problems are not related to my ability to understand the material but instead I have not been studying outside of class enough to be comfortable in these subjects.

A skill I need to work on is time management. This most fits into scheduling on the rubric and Professionalism/Work Ethic on NACE. Mostly it's just procrastination although I have started working on it this semester. I have started scheduling specific homework to get done by certain days instead of working on homework whenever I feel like it. Good time management has many obvious benefits within and outside of the class environment, and the biggest benefit I would like to achieve is more study time for tests to improve grades or feel more comfortable on tests. Occasionally I will have a test where I spend 2-3 days slowly getting homework done and around a day for test studying, whereas if I manage my procrastination I could spend 1 day on homework and 2-3 on test preparation.
